

Results on Photon Structure Functions

from

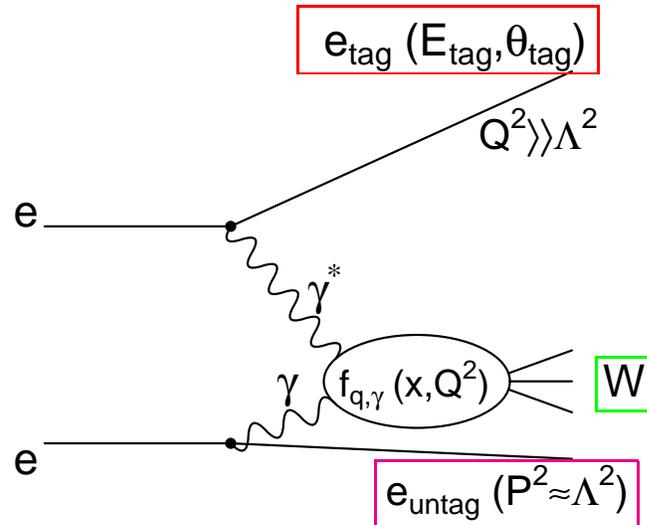

Richard Nisius, CERN
Jerusalem, 20 August 1997

- Lepton pairs and $F_{k,QED}^\gamma$, $k = 2, A, B$
- Hadronic $F_2^\gamma(x, Q^2)$

Electron-Photon Scattering

$$\frac{d^2 \sigma_{e\gamma \rightarrow eX}}{dx dQ^2} = \frac{2\pi\alpha^2}{x Q^4} \cdot$$

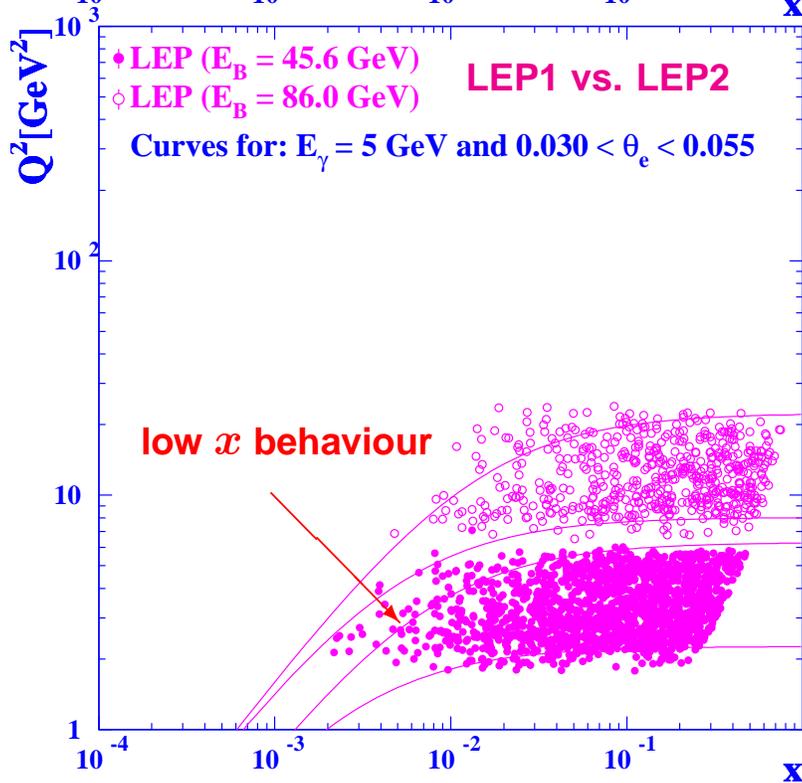

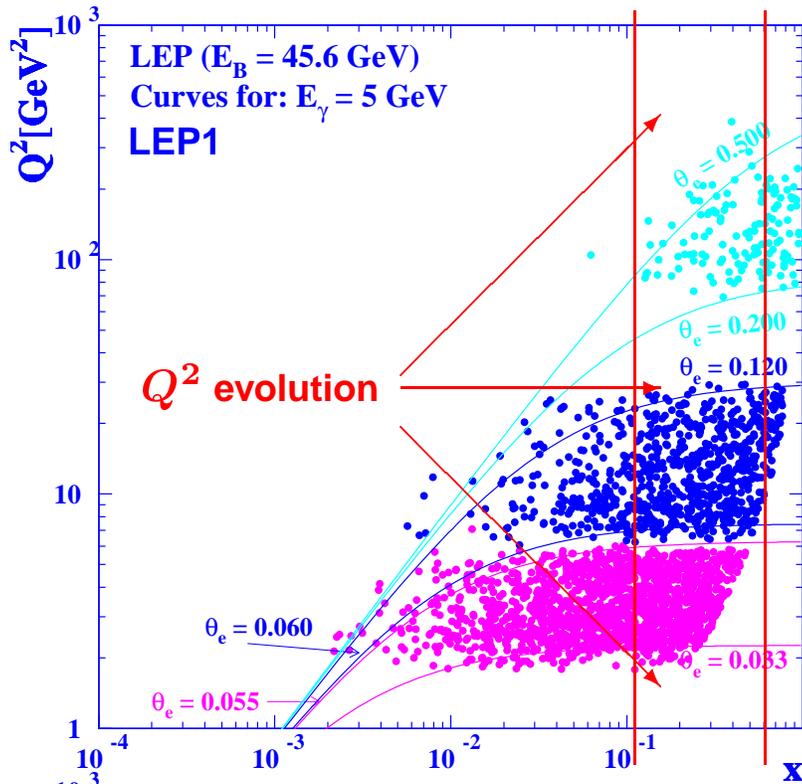

$$\left[(1 + (1 - y)^2) F_2^\gamma(x, Q^2) - \underbrace{y^2 F_L^\gamma(x, Q^2)}_{\rightarrow 0} \right]$$

$$Q^2 = 2 E_b E_{\text{tag}} (1 - \cos \theta_{\text{tag}}) \gg P^2$$

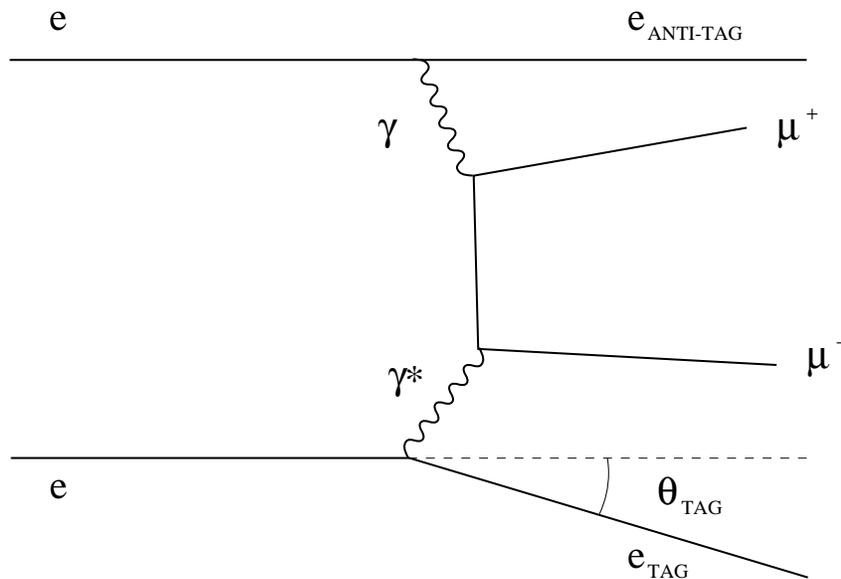

$$x = \frac{Q^2}{Q^2 + W^2 + P^2}$$

$$y = 1 - \frac{E_{\text{tag}}}{E_b} \cos^2\left(\frac{\theta_{\text{tag}}}{2}\right) \ll 1$$

The $x - Q^2$ plane

The production of lepton pairs

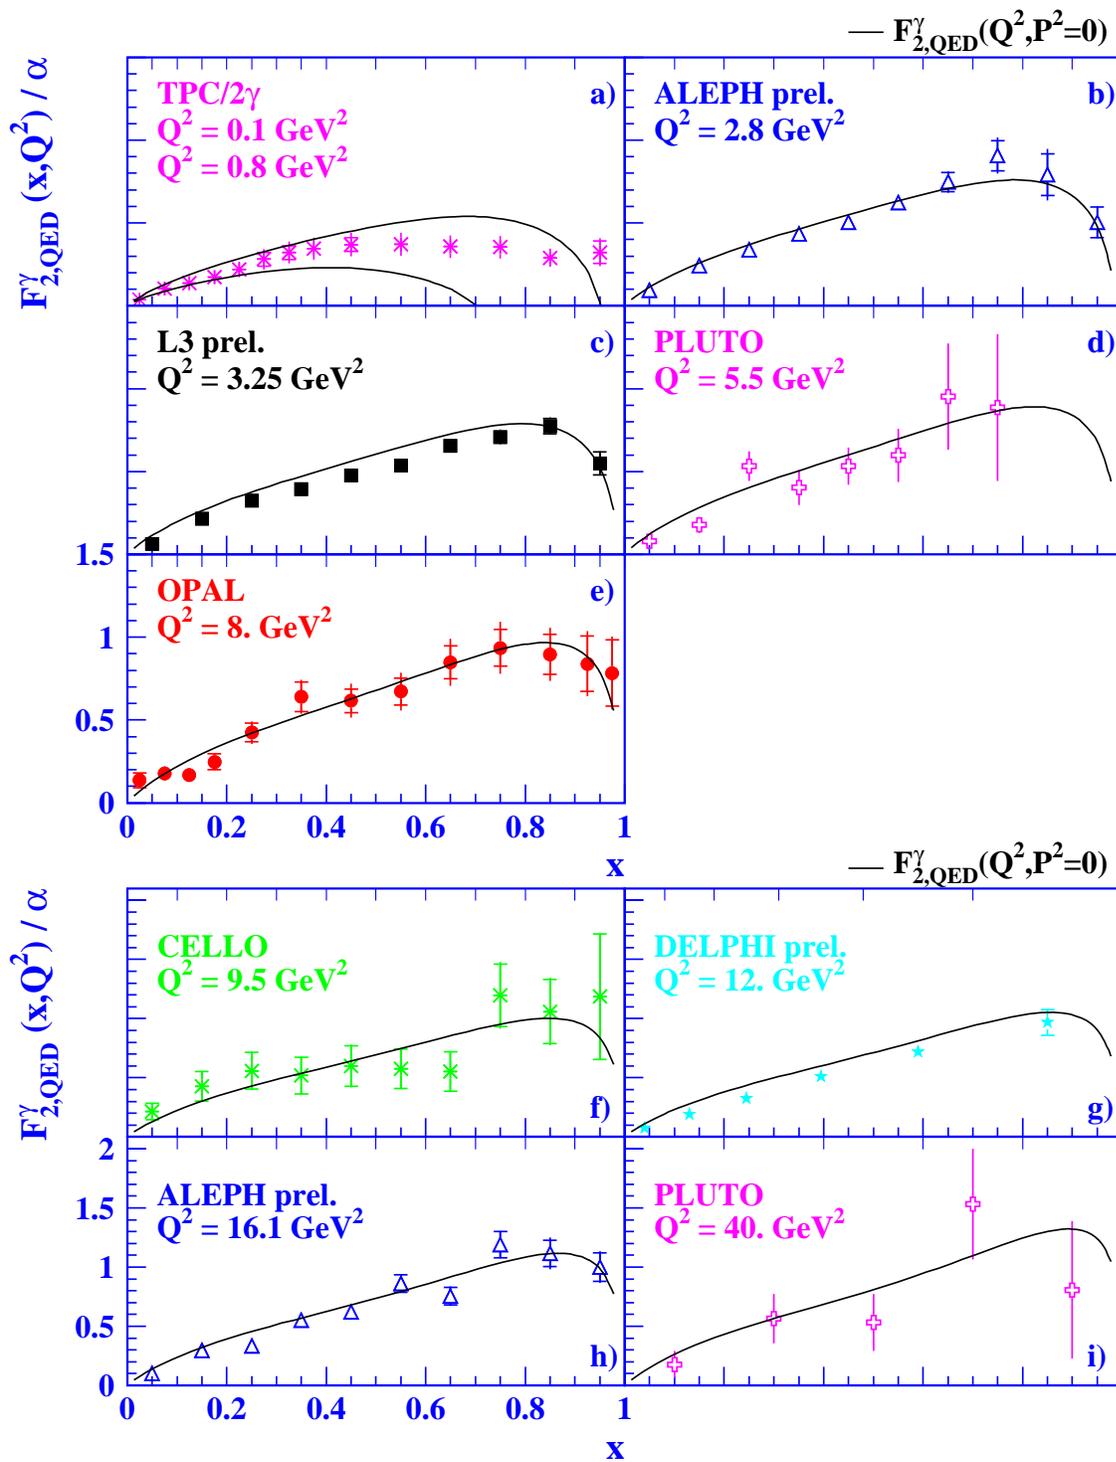

$$\frac{d^2\sigma_{e\gamma \rightarrow e\mu^+\mu^-}}{dx dQ^2} = \frac{2\pi\alpha^2}{x Q^4} \left[(1 + (1 - y)^2) F_{2,\text{QED}}^\gamma - y^2 F_{L,\text{QED}}^\gamma \right]$$

$$F_{2,\text{QED}}^\gamma(x, Q^2, P^2)/\alpha \approx \frac{x}{\pi} \left[1 - 2x(1 - x) \ln \frac{W^2}{m_\mu^2 + x(1 - x)P^2} - 1 + 8x(1 - x) - \frac{x(1 - x)P^2}{m_\mu^2 + x(1 - x)P^2} \right]$$

$$F_{L,\text{QED}}^\gamma(x, Q^2, P^2 = 0)/\alpha \approx \frac{4}{\pi} x^2(1 - x)$$

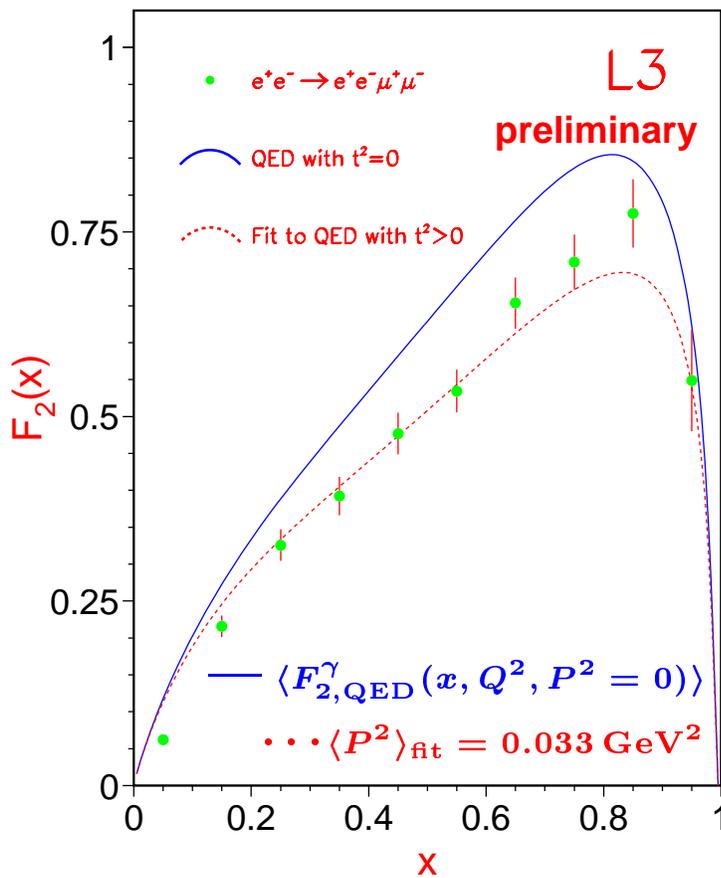

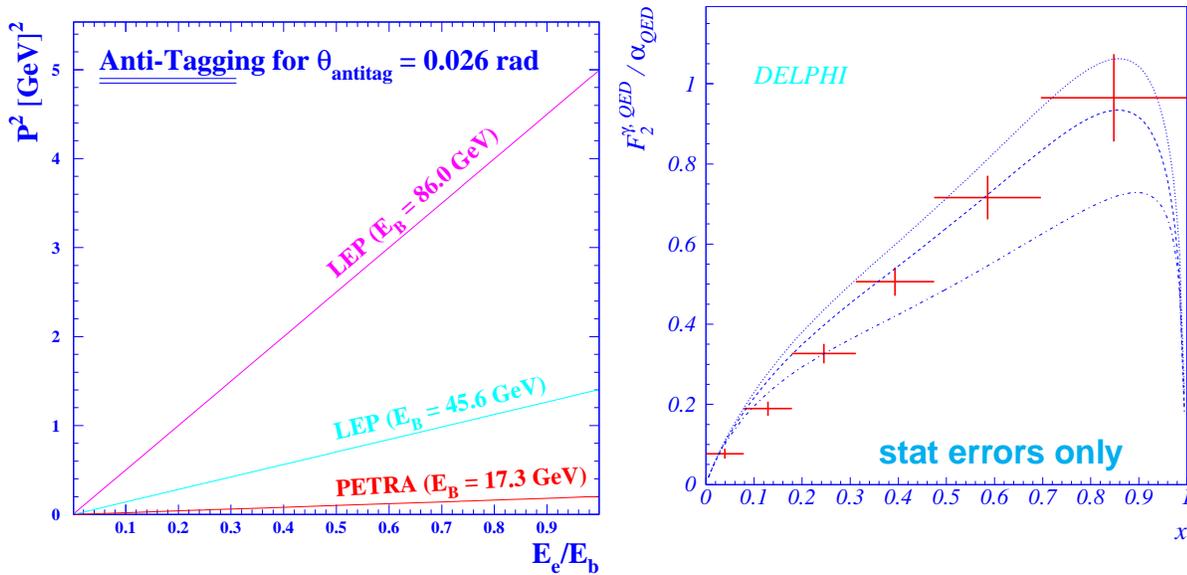

⇒ QED is a well suited study ground for structure function analysis

Measurements of $F_{2,QED}^\gamma$

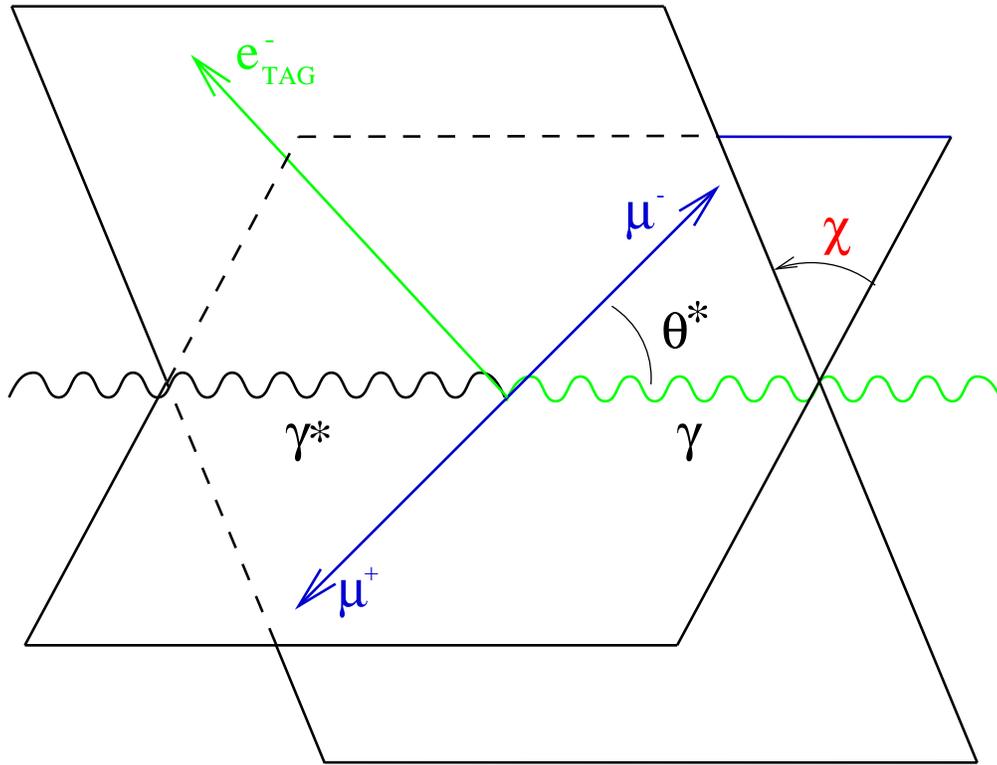

All results are according to expectations from QED

$F_{2,QED}^\gamma$ for virtual photons

For $F_{2,QED}^\gamma$ the effect of the photon virtuality P^2 is clearly seen

Azimuthal Correlations

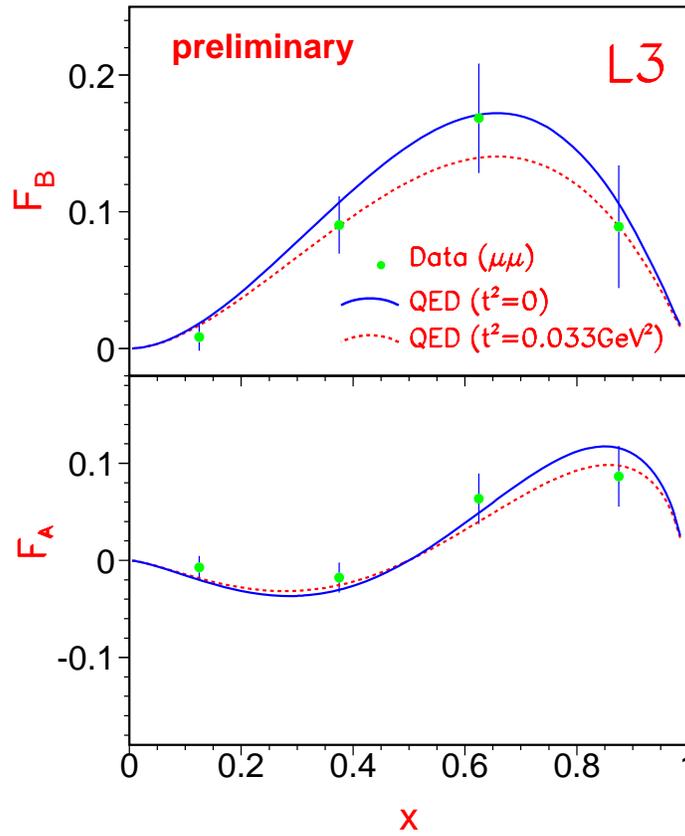

$$e\gamma \rightarrow e\mu^+\mu^-$$

$$d\sigma \propto \left(1 + (F_A^\gamma/F_2^\gamma) \cdot \cos \chi + \frac{1}{2}\epsilon(F_B^\gamma/F_2^\gamma) \cdot \cos 2\chi \right)$$

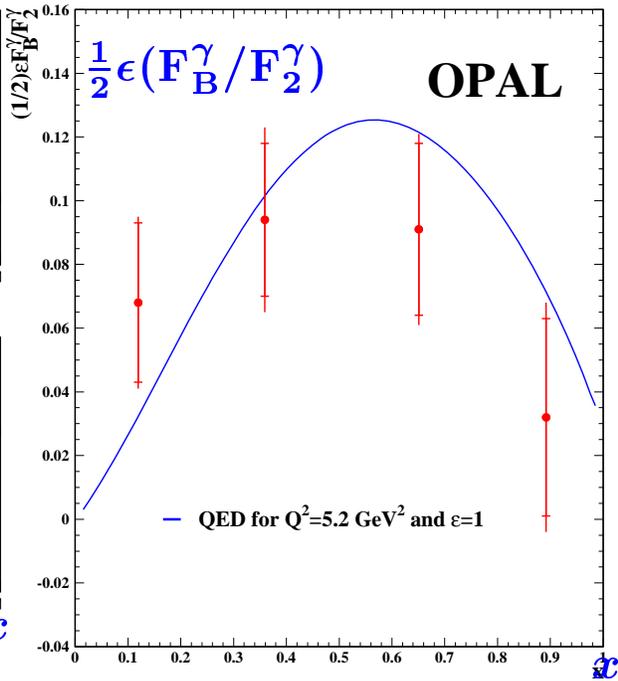

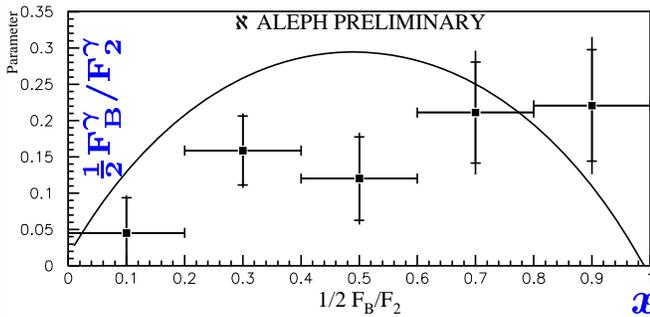

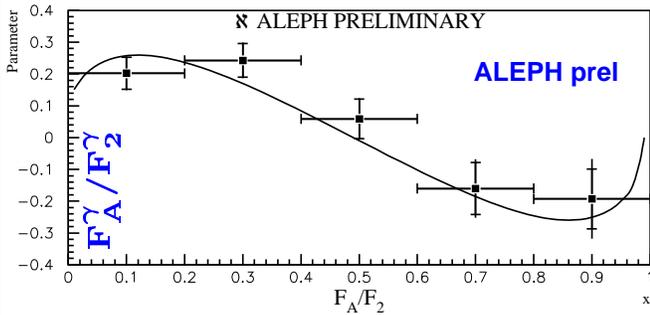

$$\frac{1}{2}\epsilon = \frac{(1-y)}{1+(1-y)^2} \approx 1$$

The χ dependence gives access to other structure functions
besides $F_{2,QED}^\gamma$

Other QED structure functions

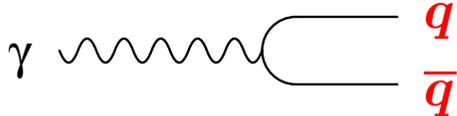

Results for 1994 Data

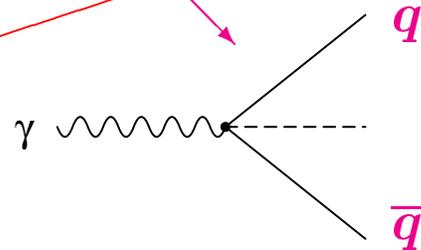

The contributions to $F_2^\gamma(x, Q^2)$

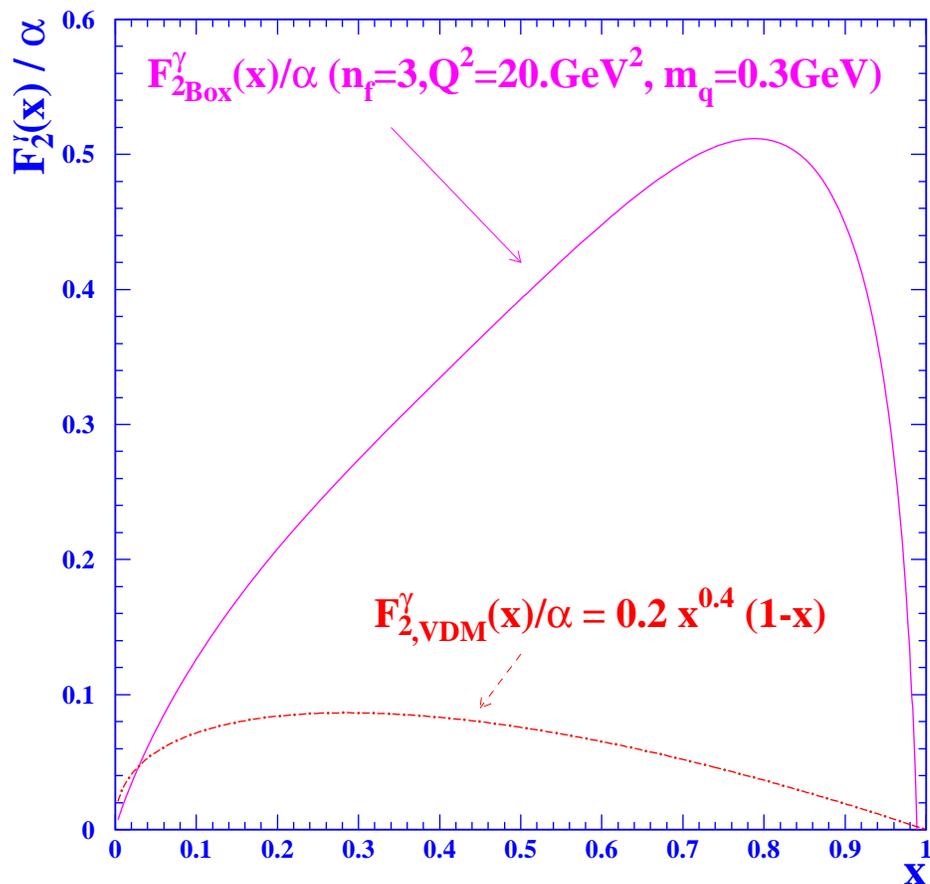

$$F_2^\gamma(x, Q^2) = x \sum_{c,f} e_q^2 f_{q,\gamma}(x, Q^2)$$

'hadronic', $p_T = \text{"small"}$
non-perturbative
VDM (ρ, ω, ϕ)

'pointlike', $p_T = \text{"large"}$
perturbative

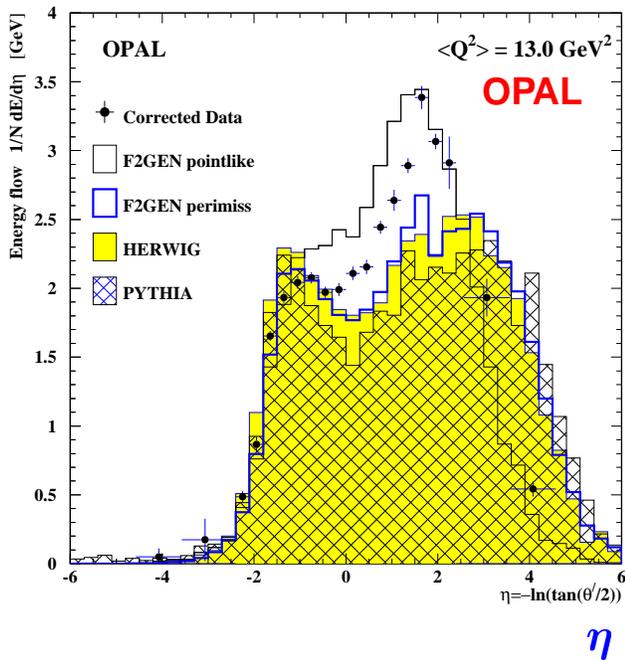

The general procedure to measure F_2^γ

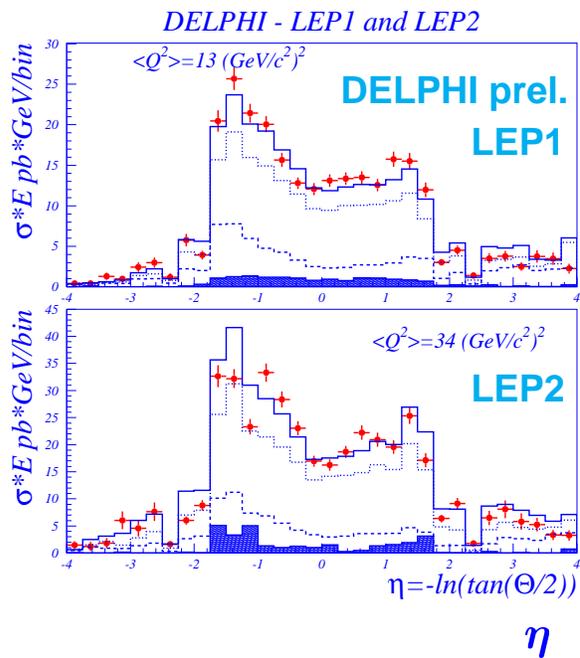

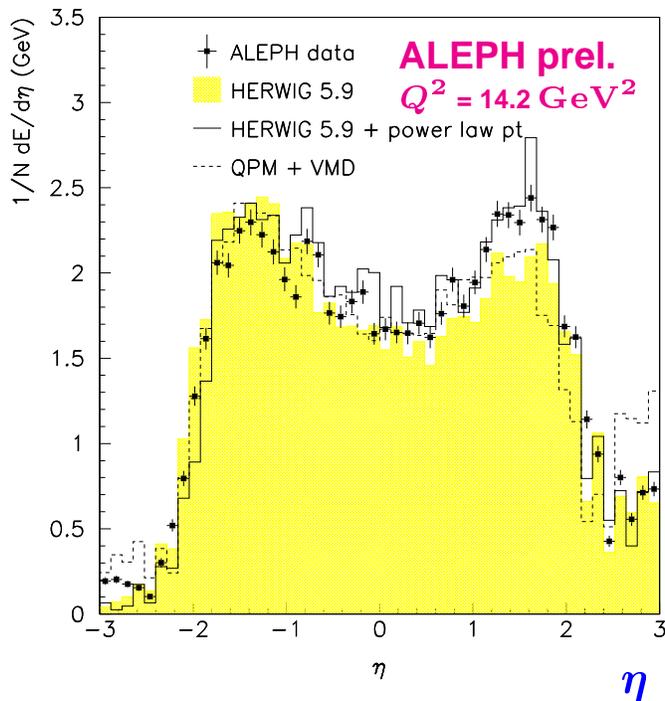

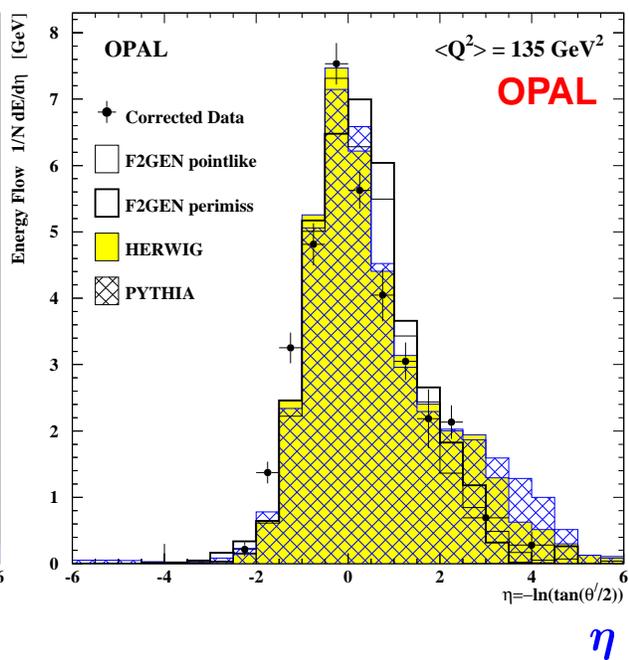

1. Events are triggered with **high efficiency** by the luminosity detectors nearly **independent** of the hadronic final state.
2. Q^2 is **accurately** measured from the electron.
3. E_γ is **unknown** and **varies** from event to event
 $\Rightarrow W_{\text{vis}}$ **has to be** measured from the **hadrons**.
(**No** electron alone method as e.g. at HERA)
4. x is obtained from x_{vis} via unfolding (Blobel, ...)
 \Rightarrow **Dependence** on the formation of the **hadronic final state** as assumed by the **Monte Carlo** models!
(For details see talk by J. A. Lauber Pa2)

The model dependence

$1/N dE/d\eta$

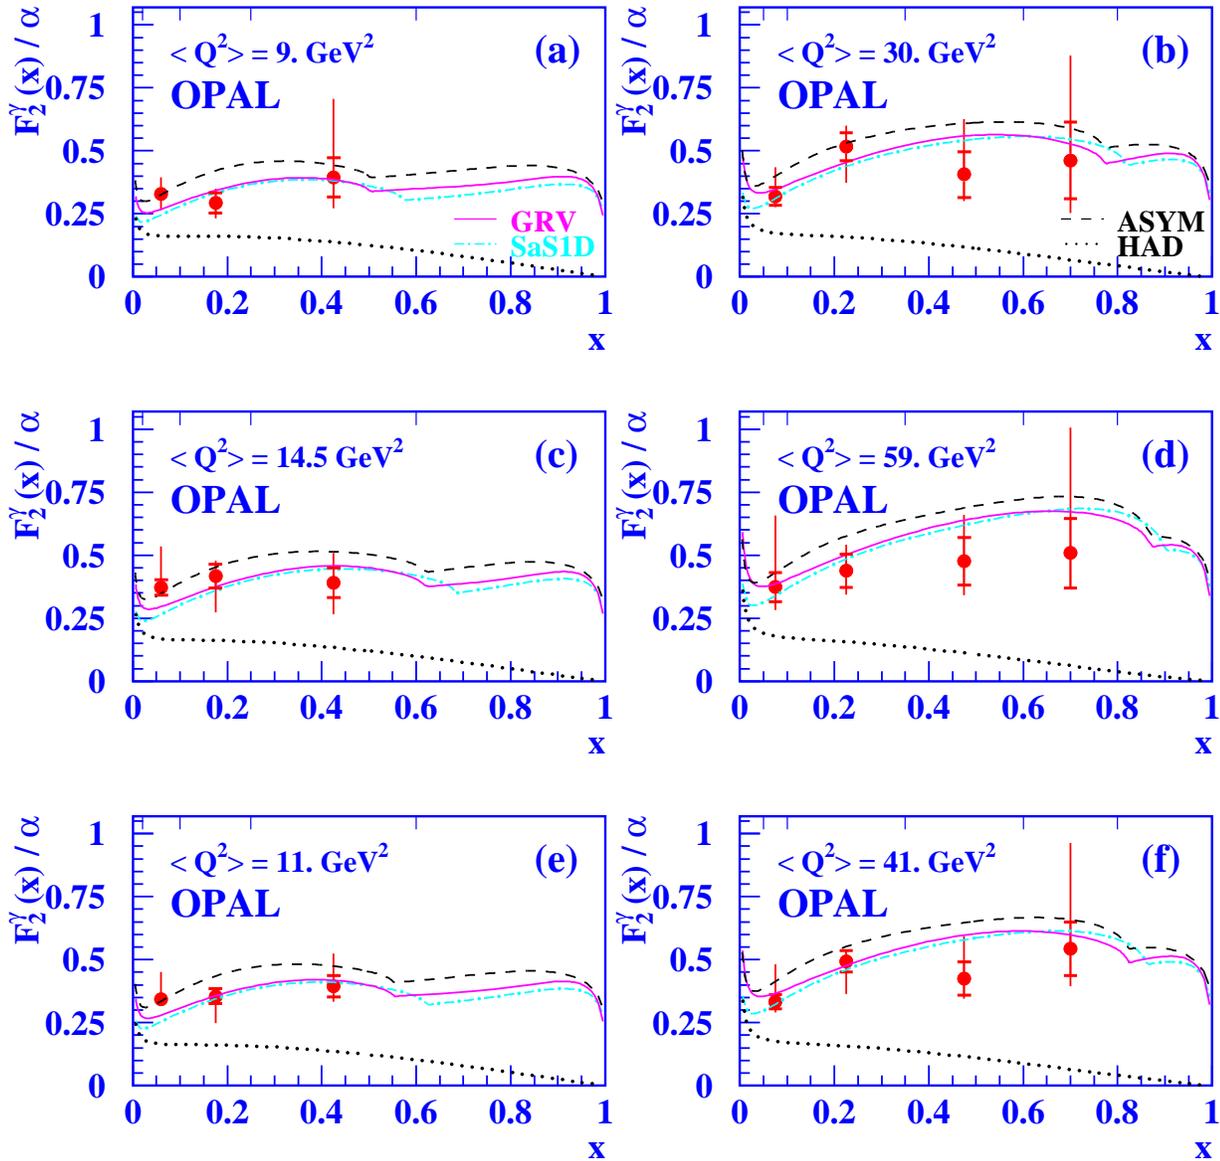

$1/N dE/d\eta$

Improvements on the Monte Carlo programs are needed

F_2^γ compared to various models

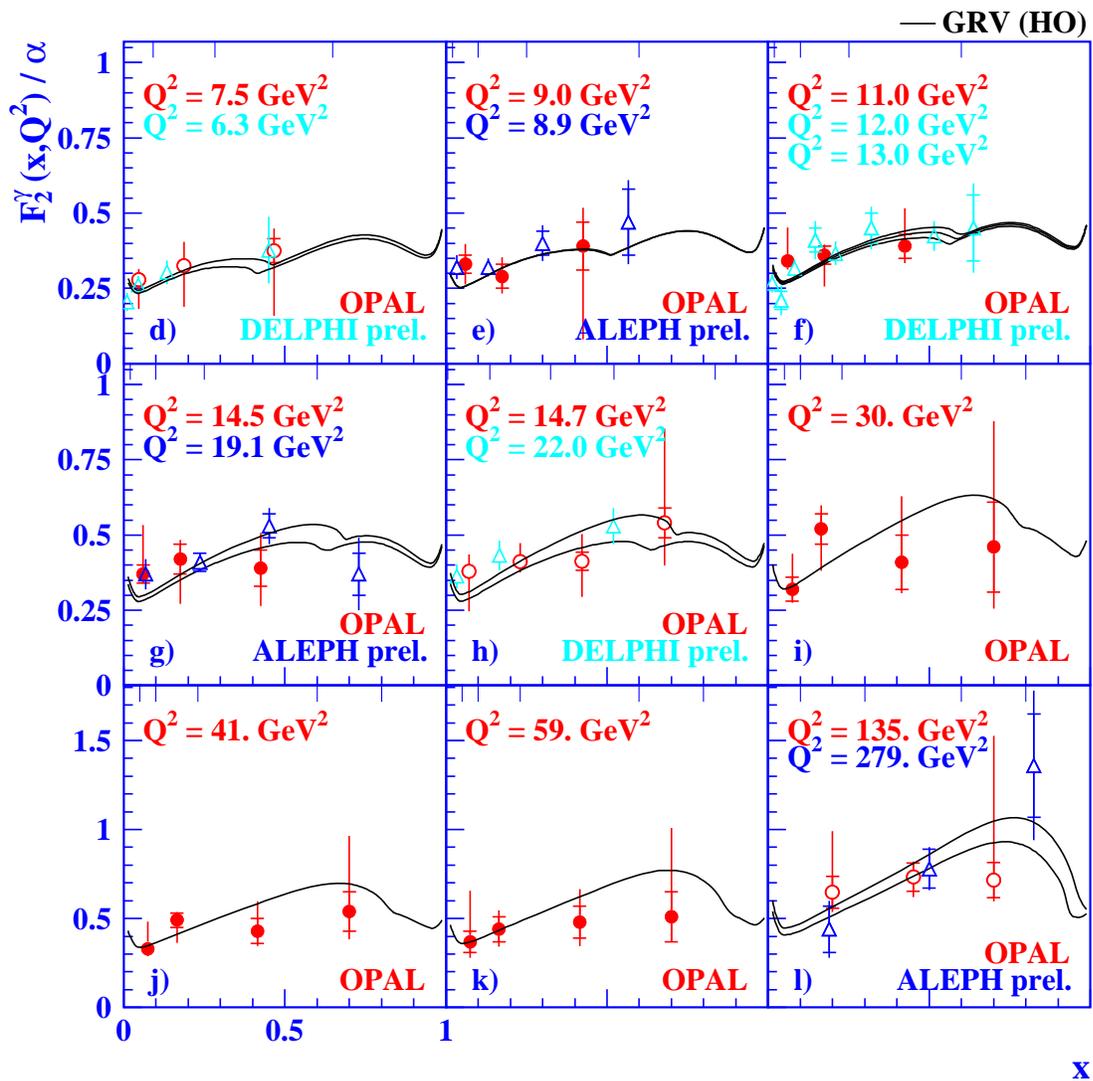

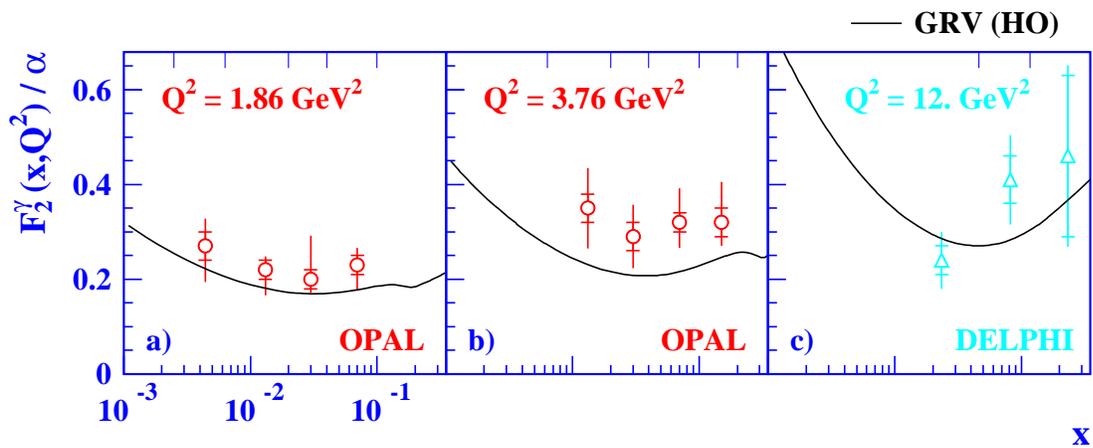

ASYM \equiv asymptotic solution for $n_f = 3$ (Witten LO)

\oplus massive charm (Bethe Heitler LO) \oplus HAD (GRV VDM LO)

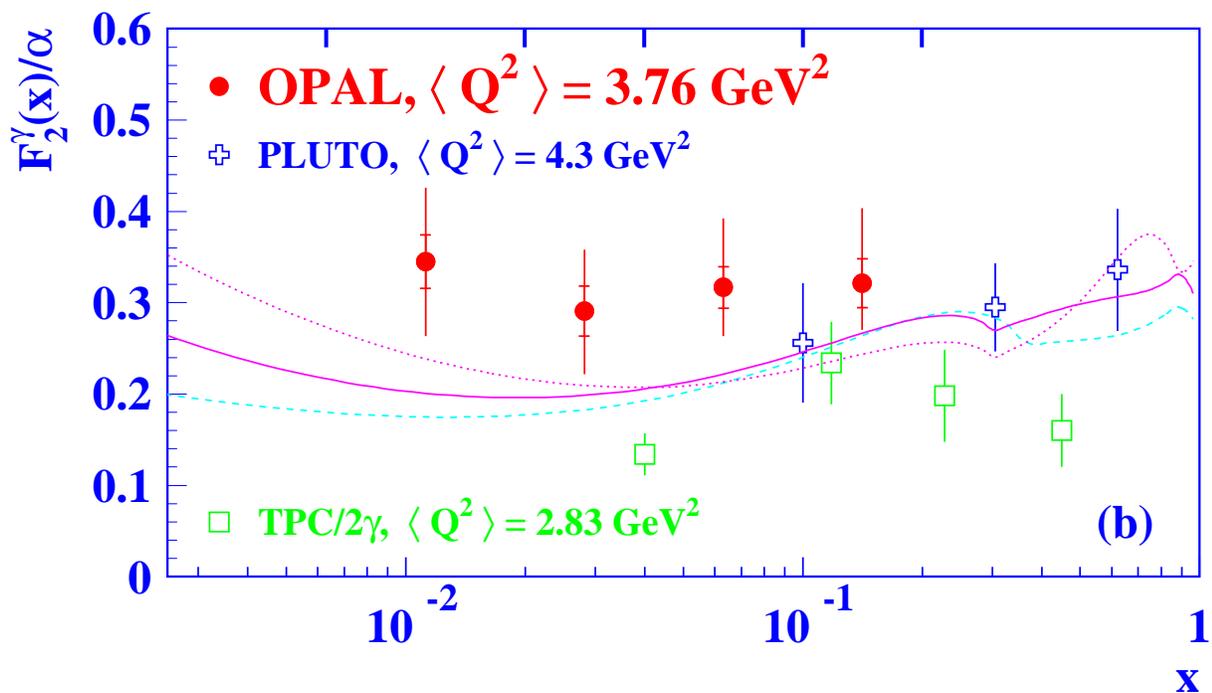

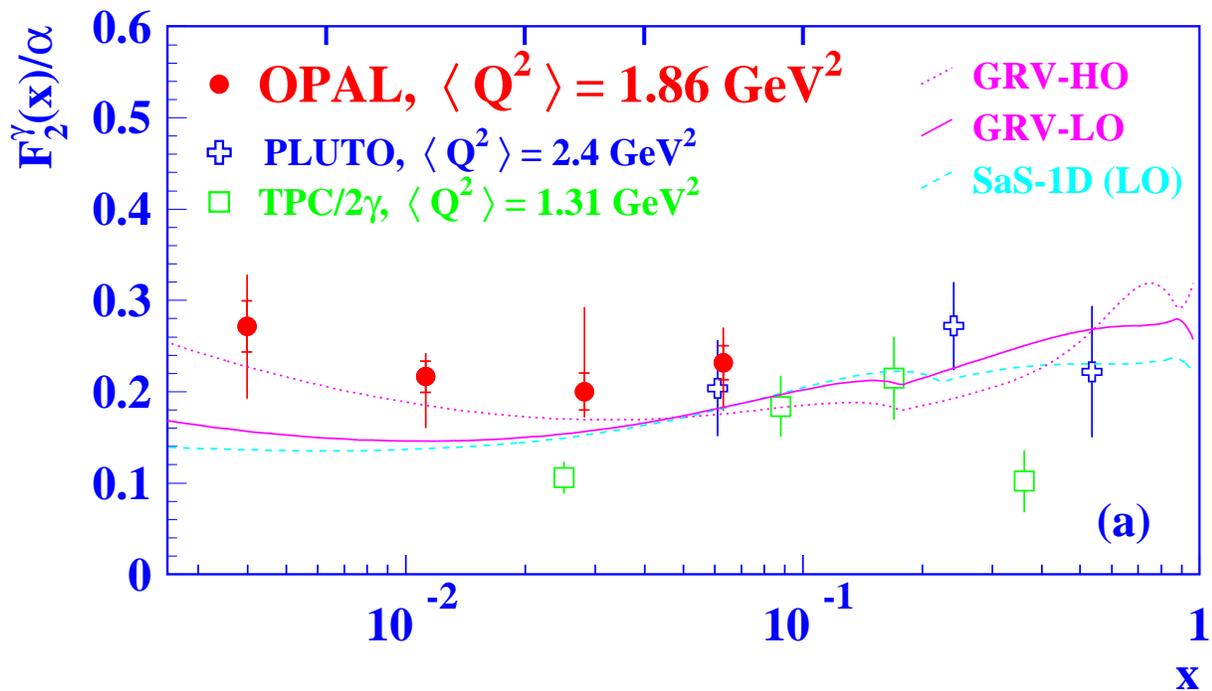

GRV \equiv Glück, Reya, Vogt LO

SaS \equiv Schuler, Sjöstrand SaS1D LO

The LEP data on F_2^γ

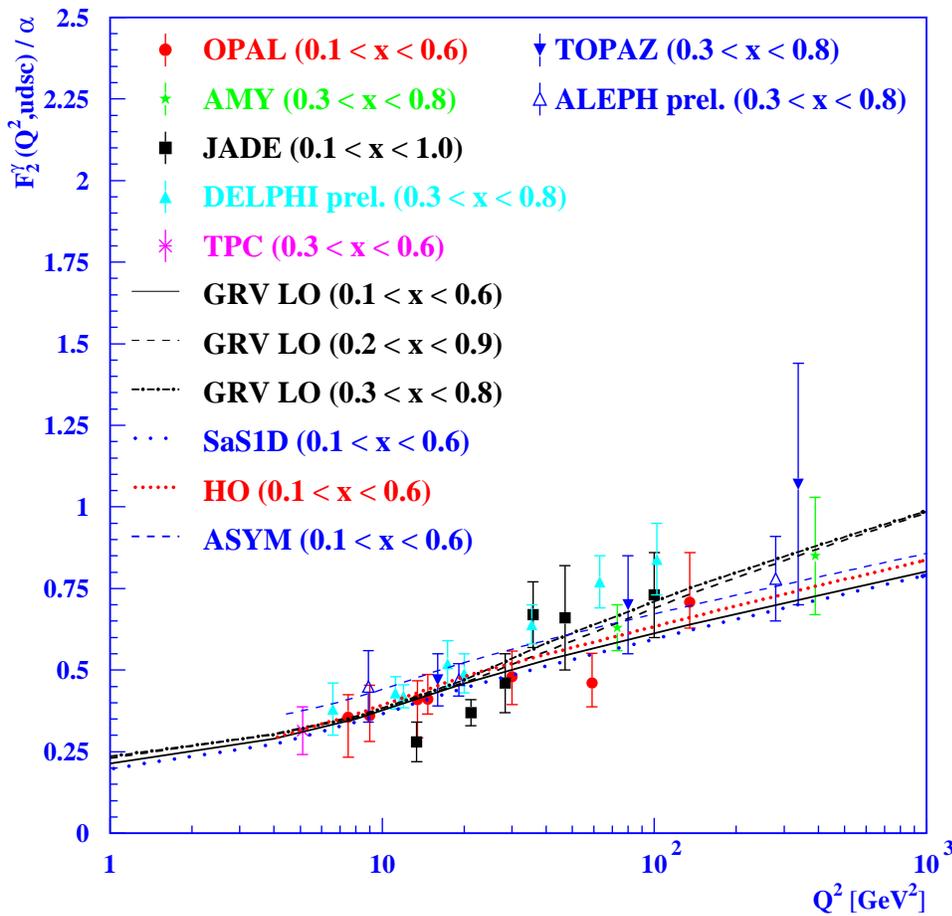

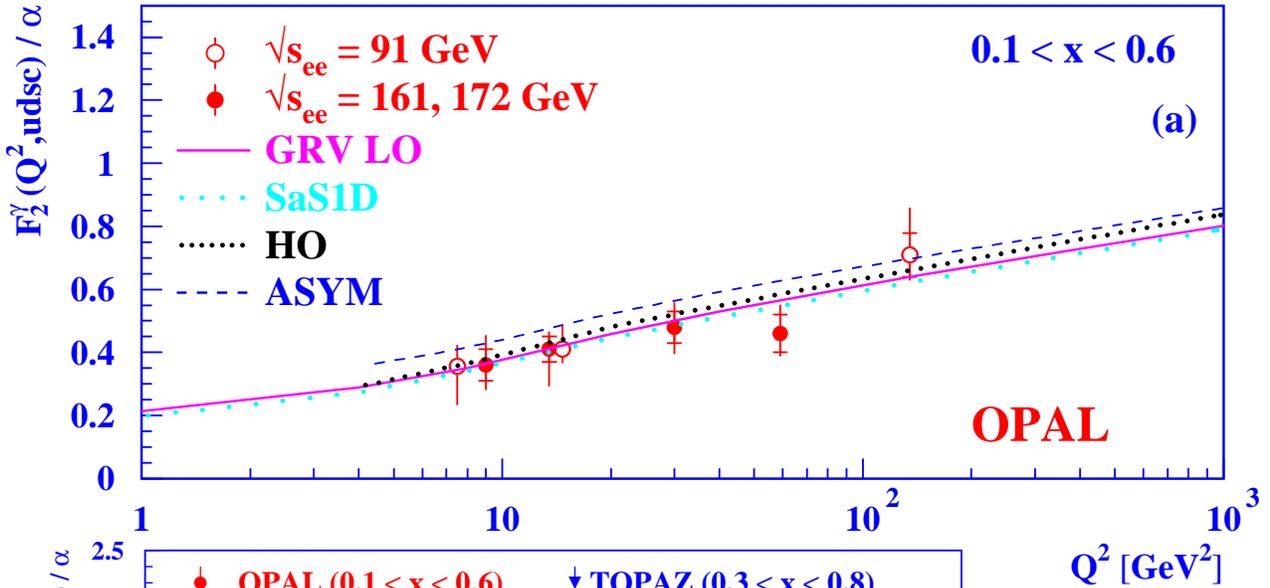

The region of low x and Q^2

The Q^2 evolution of F_2^γ

$$F_2^\gamma = (0.16 \pm 0.05^{+0.17}_{-0.16}) + (0.10 \pm 0.02^{+0.05}_{-0.02}) \ln(Q^2/\text{GeV}^2)$$

Conclusions

1. QED structure functions are in nice agreement with the data.
2. The determination of the hadronic structure function is very difficult. Monte Carlo models need to be improved to bring the systematic errors down for the regions of low- and high- x .
3. The evolution of F_2^γ with Q^2 is found to be logarithmic, as predicted by QCD, but precision tests of $d(F_2^\gamma / \alpha) / d \ln Q^2$ are not yet in sight.
4. Structure function measurements are a very active field at LEP with good prospects for the LEP2 programme.

I would like to thank the LEP Collaborations, especially C. Brew, A. Finch, S. Söldner Rembold, G. Susinno and A. Wright.
